

## Quiz #11

---

Name: \_\_\_\_\_

**Use a pencil, not a pen.**

### Springs and Oscillations

1. When hanging vertically, a spring has a length of 35 cm. Then, a mass of 200 g is added to it. The mass causes the spring to stretch by 5 cm. What is the elastic “spring” constant? Note that you’ll want to do some unit conversions... and remember that mass is not weight!

$$k_{\text{spring}} = \quad \text{N/m}$$

2. A certain spring hangs vertically. A mass of 200 g is added to it, and then pulled and released so that the mass bounces up and down. The period for each bounce is  $T = 1.2$  s. First, find the angular frequency using  $\omega = \frac{2\pi}{T}$ .

$$\omega = \quad \text{rad/s}$$

3. Now that we have a value for  $\omega$ , determine  $k$  using  $\omega = \sqrt{\frac{k}{m}}$ .

$$k_{\text{spring}} = \quad \text{N/m}$$

4. Algebra: use both formulas given in the previous two problems to symbolically solve for  $T^2$  in terms of  $m$ . This is symbolic, so forget that you already found some numbers! I already wrote the “ $m$ ” for you in the answer box. The result may not include  $\omega$ .

$$T^2 = \text{_____} \cdot m$$

5. Algebra: the entire fraction in front of the “ $m$ ” is the slope “ $s$ ” (if you plot  $T^2$  vs  $m$ ). Symbolically solve for  $k$  in terms of the slope  $s$ . Your answer may not include either  $m$  or  $T$ . Make sure your  $s$  doesn’t look like a 5.

$$k = \text{_____}$$

6. A pendulum (not a spring!) has a small mass of 17 g suspended on a thin string of length 22 cm. What is the period of the pendulum’s swing?

$$T_{\text{pendulum}} = \quad \text{s}$$

7. Algebra: re-arrange the same equation that you just used to find  $T^2$  in terms of  $L$ .

$$T^2 = \text{_____} \cdot L$$
